Supplemental Materials

Potential confound in Lag Recency analysis: Differences in base rates of R and K data

Here we rule out a possible confound of our results of differential lag-recency effects between R and K responses. We examined the possibility that the steeper CRP curve for R than for K responses was a confound of the smaller proportion of K responses than of R responses. To reiterate, the smaller proportion of K responses should lead to a larger variability which, in fact, would render it harder to find a significant difference between the CRP curves of R and K. Still, to categorically rule out the possible confound of differences in base rate between R and K responses, we conducted a surrogate data analysis (see also Howard, Youker, & Venkatadass, 2008).

The goal of this analysis was to show that the difference between the temporal-contiguity effect of our empirically-derived R and K responses is significantly greater than the difference which is obtained by random R/K labeling of the recalled items, when the empirical R/K proportions are maintained. To this end, we compared the difference between the temporal factor scores of R and K in our empirically-derived data with the difference between the temporal factor scores of two levels of a random condition. The two levels of this condition (henceforth "Random-R" and "Random-K") were created by randomly dividing the data into simulated R and K categories while maintaining the same proportions of the two categories as observed in our empirical dataset for R and K responses.

We performed 1,000 iterations of the following: First we randomly divided each participant's data of all recall transitions to Random-R and Random-K categories according to her own *empirically*-derived proportions of R and K responses. We then calculated for each

For Review Only

participant the Random-R and Random-K temporal factor scores. Finally, we calculated the across-subject mean of the differences between Random-R and Random-K temporal factor scores. The 1,000 iterations thus generated a distribution of the across-participant mean of the differences between Random-R and Random-K temporal factor scores. We then computed the percentile ranking of the empirical temporal factor scores' difference, among the 1,000 random temporal factor scores' differences.

The empirical temporal factor scores' difference was 0.042. Critically, the empirical temporal factor scores' difference was greater than the 0.1^{th} percentile of the random b-coefficients distribution. That is, 99.9% of the 1,000 iterations rendered a smaller R-K temporal factor scores' difference, with their mean approaching zero. Our empirical data thus deviate significantly from the surrogate dataset, which was created under the assumption that R and K responses reflect a completely random division. Because the division of our surrogate dataset to Random-R and Random-K maintained the same proportions as in the empirical dataset, it is therefore highly unlikely that baseline differences mediated the differences between the R and K temporal contiguity effects.

General

The following package contains data files for the experiment described in Sadeh, Moran & Goshen-Gottstein, 2014.

For each of the 88 subjects who participated in the experiment, the data consists of 25 study lists, each including 12 words. For all data files, each row corresponds to data for one list and for one subject (for a total of 25 rows for each subject). Each cell represents one response. "0" represents no data for a given cell or other data (see below).

List of data files

1) recalls_ser_pos.xlsx: data for the test phase of the experiment. In this file, data represents the study serial position of each word retrieved. "0" represents prior-list intrusions or extra-list intrusions.

2) recalls_RK.xlsx: data for the test phase of the experiment. In this file, subjects' responses are classified into two categories:
   a. "Remember" responses – indexed "1"
   b. "Know" responses – indexed "2"

3) recalls_abs_con.xlsx: data for the test phase of the experiment. In this file, subjects' responses are classified into two categories:
   a. "Abstract" responses (namely, words recalled that were classified as abstract at study) – indexed "1"
   b. "Concrete" responses (namely, words recalled that were classified as concrete at study) – indexed "2"

   Note, that for some of the words abstract/concrete judgments were not given within the timeframe of the study trial. These responses are indexed "0".

4) recalls_IRTs.xlsx: data for the test phase of the experiment. In this file, subjects' inter-response intervals (IRTs; in milliseconds) for each word recalled are given. IRT = the time from the end of retrieval of the previous word (when subjects categorized the word as "Remember" or "Know") until subjects typed the first letter of the current word.

5) study_abs_con.xlsx: data for the study phase of the experiment. In this file, subjects' responses are classified into two categories:
    a. "Abstract" responses (namely, words classified as abstract) – indexed "1"
    b. "Concrete" responses (namely, words classified as concrete) – indexed "2"

    Note, that for some of the words abstract/concrete judgments were not given within the timeframe of the study trial. These responses are indexed "0".

6) study_RTs.xlsx: data for the study phase of the experiment. In this file, subjects' RTs (in milliseconds) for each word studied are given. RT = the time from presentation of the study word until participants' response in the abstract/consecrate judgment task.
